

## Contra $\alpha^*$ Continuous Functions in Topological Spaces

S. Pious Missier<sup>1</sup>, P. Anbarasi Rodrigo<sup>2</sup>

**Abstract:** In [3], Dontchev introduced and investigated a new notion of continuity called contra-continuity. Recently, Jafari and Noiri [5] introduced new generalization of contra-continuity called contra  $\alpha$  continuity. The aim of this paper is to introduce and study the concept of a contra  $\alpha^*$  continuous and almost contra  $\alpha^*$  continuous functions are introduced

**MATHEMATICS SUBJECT CLASSIFICATIONS:** 54A05

**Keywords And Phrases:** contra  $\alpha^*$  continuous functions, almost contra  $\alpha^*$  continuous functions, contra  $\alpha^*$  graph, and locally  $\alpha^*$  indiscrete space.

### I. Introduction

Dontchev[3] introduced the notion of contra continuity. Later Jafari and Noiri introduced and investigated the concept of contra  $\alpha$  continuous and discussed its properties. Recently, S.Pious Missier and P. Anbarasi Rodrigo [9] have introduced the concept of  $\alpha^*$ -open sets and studied their properties. In this paper we introduce and investigate the contra  $\alpha^*$  continuous functions and almost contra  $\alpha^*$  continuous functions and discuss some of its properties.

### II. Preliminaries

Throughout this paper  $(X, \tau)$ ,  $(Y, \sigma)$  and  $(Z, \eta)$  or  $X, Y, Z$  represent non-empty topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset  $A$  of a space  $(X, \tau)$ ,  $\text{cl}(A)$  and  $\text{int}(A)$  denote the closure and the interior of  $A$  respectively. The power set of  $X$  is denoted by  $P(X)$ .

**Definition 2.1:** A subset  $A$  of a topological space  $X$  is said to be a  $\alpha^*$ open [9] if  $A \subseteq \text{int}^*(\text{cl}(\text{int}^*(A)))$ .

**Definition 2.2:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a  $\alpha^*$  continuous [10] if  $f^{-1}(O)$  is a  $\alpha^*$ open set of  $(X, \tau)$  for every open set  $O$  of  $(Y, \sigma)$ .

**Definition 2.3:** A map  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be *perfectly  $\alpha^*$  continuous* [11] if the inverse image of every  $\alpha^*$ open set in  $(Y, \sigma)$  is both open and closed in  $(X, \tau)$ .

**Definition 2.4:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be  $\alpha^*$ Irresolute [10] if  $f^{-1}(O)$  is a  $\alpha^*$ open in  $(X, \tau)$  for every  $\alpha^*$ open set  $O$  in  $(Y, \sigma)$ .

**Definition 2.5:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a *contra g continuous* [2] if  $f^{-1}(O)$  is a **g-closed** set [6] of  $(X, \tau)$  for every open set  $O$  of  $(Y, \sigma)$ .

**Definition 2.6:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a *contra continuous* [3] if  $f^{-1}(O)$  is a closed set of  $(X, \tau)$  for every open set  $O$  of  $(Y, \sigma)$ .

**Definition 2.7:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a *contra  $\alpha$  continuous* [5] if  $f^{-1}(O)$  is a  $\alpha$  closed set of  $(X, \tau)$  for every open set  $O$  of  $(Y, \sigma)$ .

**Definition 2.8:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a *contra semi continuous* [4] if  $f^{-1}(O)$  is a semi closed set of  $(X, \tau)$  for every open set  $O$  of  $(Y, \sigma)$ .

**Definition 2.9:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a *contra g  $\alpha$  continuous* [1] if  $f^{-1}(O)$  is a  $g\alpha$ -closed set of  $(X, \tau)$  for every open set  $O$  of  $(Y, \sigma)$ .

**Definition 2.10:** A Topological space  $X$  is said to be  $\alpha^*$  $T_{1/2}$  space or  $\alpha^*$ space [9] if every  $\alpha^*$  open set of  $X$  is open in  $X$ .

**Definition 2.11:** A Topological space  $X$  is said to be a *locally indiscrete* [7] if each open subset of  $X$  is closed in  $X$ .

**Definition 2.12:** Let  $A$  be a subset of a topological space  $(X, \tau)$ . The set  $\bigcap \{U \in \tau \mid A \subset U\}$  is called the *Kernel of A* [7] and is denoted by  $\text{ker}(A)$ .

**Lemma 2.13:** [6] The following properties hold for subsets  $A, B$  of a space  $X$ :

1.  $x \in \text{ker}(A)$  if and only if  $A \cap F \neq \emptyset$ , for any  $F \in C(X, x)$ ;

2.  $A \subset \ker(A)$  and  $A = \ker(A)$  if  $A$  is open in  $X$ ;
3. If  $A \subset B$ , then  $\ker(A) \subset \ker(B)$ .

**Theorem 2.14:** [10] Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function. Then the following are equivalent:

1.  $f$  is  $\alpha^*$  continuous
2. The inverse image of closed set in  $Y$  is  $\alpha^*$  closed in  $X$ .
3.  $f(\alpha^* \text{cl}(A)) \subseteq f(\text{cl}(A))$  for every subset  $A$  in  $X$ .
4.  $\alpha^* \text{cl}(f^{-1}(G)) \subseteq f^{-1}(\text{cl}(G))$  for every subset  $G$  of  $Y$ .
5.  $f^{-1}(\text{int}(G)) \subseteq \alpha^* \text{int}(f^{-1}(G))$  for every subset  $G$  of  $Y$ .

**Theorem 2.15**[9]:

- (i) Every open set is  $\alpha^*$ -open and every closed set is  $\alpha^*$ -closed set
- (ii) Every  $\alpha$ -open set is  $\alpha^*$ -open and every  $\alpha$ -closed set is  $\alpha^*$ -closed.
- (iii) Every  $g$ -open set is  $\alpha^*$ -open and every  $g$ -closed set is  $\alpha^*$ -closed.

### III. Contra $\alpha^*$ continuous functions

**Definition 3.1:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called **Contra  $\alpha^*$  continuous functions** if  $f^{-1}(O)$  is  $\alpha^*$  closed in  $(X, \tau)$  for every open set  $O$  in  $(Y, \sigma)$ .

**Example 3.2:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\emptyset, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{ab\}, \{abc\}, Y\}$ .  $\alpha^*C(X, \tau) = \{\emptyset, \{d\}, \{ad\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$  Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(b) = a = f(d)$ ,  $f(c) = b$ ,  $f(a) = c$ . clearly,  $f$  is contra  $\alpha^*$  continuous.

**Theorem 3.3:** Every contra continuous function is a contra  $\alpha^*$  continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function. Let  $O$  be an open set in  $(Y, \sigma)$ . Since,  $f$  is contra continuous, then  $f^{-1}(O)$  is closed in  $(X, \tau)$ . Hence by thm [2.15],  $f^{-1}(O)$  is  $\alpha^*$  closed in  $(X, \tau)$ . Therefore,  $f$  is contra  $\alpha^*$  continuous.

**Remark 3.4 :** The converse of the above theorem need not be true.

**Example 3.5:** : Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\emptyset, \{a\}, \{ab\}, \{abc\}, X\}$ ,  $\tau^c = \{\emptyset, \{d\}, \{cd\}, \{bcd\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, Y\}$ .  $\alpha^*C(X, \tau) = \{\emptyset, \{b\}, \{c\}, \{d\}, \{ad\}, \{bc\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a = f(d)$ ,  $f(b) = b$ ,  $f(c) = d$ . clearly,  $f$  is contra  $\alpha^*$  continuous, but  $f^{-1}(\{a\}) = \{ad\}$  is not closed in  $X$ .

**Theorem 3.6:** Every contra  $g$  continuous map is contra  $\alpha^*$  continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a contra  $g$  continuous map and  $O$  be any open set in  $Y$ . Since,  $f$  is contra  $g$  continuous, then  $f^{-1}(O)$  is  $g$ -closed in  $(X, \tau)$ . Hence by thm [2.15],  $f^{-1}(O)$  is  $\alpha^*$  closed in  $(X, \tau)$ . Therefore,  $f$  is contra  $\alpha^*$  continuous.

**Remark 3.7:** The converse of the above theorem need not be true.

**Example 3.8:** : Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\emptyset, \{a\}, \{ab\}, \{abc\}, X\}$ ,  $g\text{-closed}(X, \tau) = \{\emptyset, \{d\}, \{ad\}, \{bd\}, \{cd\}, \{abd\}, \{bcd\}, \{acd\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, Y\}$ .  $\alpha^*C(X, \tau) = \{\emptyset, \{b\}, \{c\}, \{d\}, \{ad\}, \{bc\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a = f(d)$ ,  $f(b) = b$ ,  $f(c) = d$ . clearly,  $f$  is contra  $\alpha^*$  continuous, but  $f^{-1}(\{b\}) = \{b\}$  is not  $g$ -closed in  $X$ .

**Theorem 3.9:** Every contra  $\alpha$  continuous map is contra  $\alpha^*$  continuous.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a contra  $\alpha$  continuous map and  $O$  be any open set in  $Y$ . Since,  $f$  is contra  $\alpha$  continuous, then  $f^{-1}(O)$  is  $\alpha$ -closed in  $(X, \tau)$ . Hence by thm [2.15],  $f^{-1}(O)$  is  $\alpha^*$  closed in  $(X, \tau)$ . Therefore,  $f$  is contra  $\alpha^*$  continuous.

**Remark 3.10:** The converse of the above theorem need not be true.

**Example 3.11:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\emptyset, \{a\}, \{b\}, \{ab\}, \{bc\}, \{abc\}, X\}$ , and  $\sigma = \{\emptyset, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, Y\}$ .  $\alpha^*C(X, \tau) = \{\emptyset, \{c\}, \{d\}, \{ad\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$ .  $\alpha C(X, \tau) = \{\emptyset, \{c\}, \{d\}, \{ad\}, \{cd\}, \{acd\}, \{bcd\}, X\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(b) = a = f(d)$ ,  $f(c) = b$ ,  $f(a) = d$ . clearly,  $f$  is contra  $\alpha^*$  continuous, but  $f^{-1}(\{a\}) = \{bd\}$  is not  $\alpha$ -closed in  $X$ .

**Remark 3.12:** The concept of contra semi continuous and contra  $\alpha^*$  continuous are independent.

**Example 3.13:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\emptyset, \{a\}, \{ab\}, \{abc\}, X\}$ ,  $SC(X, \tau) = \{\emptyset, \{b\}, \{c\}, \{d\}, \{bc\}, \{bd\}, \{cd\}, \{bcd\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, Y\}$ .  $\alpha^*C(X, \tau) = \{\emptyset, \{b\}, \{c\}, \{d\}, \{ad\}, \{bc\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a = f(d)$ ,  $f(b) = b$ ,  $f(c) = d$ . clearly,  $f$  is contra  $\alpha^*$  continuous, but  $f^{-1}(\{a\}) = \{ad\}$  is not semi-closed in  $X$ .

**Example 3.14:** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \{\emptyset, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, X\}$ ,  $SC(X, \tau) = \{\emptyset, \{a\}, \{b\}, \{c\}, \{d\}, \{ab\}, \{bc\}, \{ac\}, \{ad\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$  and  $\sigma = \{\emptyset, \{a\}, \{ab\}, \{ac\}, \{abc\}, Y\}$ .  $\alpha^*C(X, \tau) = \{\emptyset, \{b\}, \{c\}, \{d\}, \{ad\}, \{bc\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$ .

$X$ }. Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a, f(b) = b, f(c) = d, f(d) = c$ . Clearly,  $f$  is semi closed, but  $f^{-1}(\{a\}) = \{a\}$  is not  $\alpha^*$ closed in  $X$ .

**Remark 3.15:** The concept of contra  $g\alpha$  continuous and contra  $\alpha^*$  continuous are independent.

**Example 3.16:** Let  $X = Y = \{a, b, c, d\}, \tau = \{\phi, \{a\}, \{b\}, \{ab\}, \{bc\}, \{abc\}, X\}$ , and  $\sigma = \{\phi, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, Y\}$ .  $\alpha^*C(X, \tau) = \{\phi, \{c\}, \{d\}, \{ad\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$ .  $g\alpha$ -Closed( $X, \tau$ ) =  $\{\phi, \{c\}, \{d\}, \{ad\}, \{cd\}, \{acd\}, \{bcd\}, X\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(b) = a, f(d) = c, f(c) = b, f(a) = d$ . clearly,  $f$  is contra  $\alpha^*$  continuous, but  $f^{-1}(\{a\}) = \{bd\}$  is not  $g\alpha$ -closed in  $X$ . Therefore,  $f$  is not contra  $g\alpha$  continuous.

**Example 3.17:** Let  $X = Y = \{a, b, c, d\}, \tau = \{\phi, \{a\}, \{b\}, \{ab\}, \{abc\}, X\}$ , and  $\sigma = \{\phi, \{a\}, \{b\}, \{ab\}, \{bc\}, \{abc\}, Y\}$ .  $\alpha^*C(X, \tau) = \{\phi, \{c\}, \{d\}, \{ad\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$ .  $g\alpha$ -Closed( $X, \tau$ ) =  $\{\phi, \{c\}, \{d\}, \{ac\}, \{ad\}, \{bc\}, \{bd\}, \{cd\}, \{acd\}, \{bcd\}, X\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a, f(c) = b, f(d) = b, f(b) = d$ . clearly,  $f$  is contra  $g\alpha$  continuous, but  $f^{-1}(\{a\}) = \{ac\}$  is not  $\alpha^*$ -closed in  $X$ . Therefore,  $f$  is not contra  $\alpha^*$  continuous.

**Remark 3.18:** The concept of  $\alpha^*$  continuous and contra  $\alpha^*$  continuous are independent.

**Example 3.19:** Let  $X = Y = \{a, b, c, d\}, \tau = \{\phi, \{a\}, \{b\}, \{ab\}, \{abc\}, X\}$  and  $\sigma = \{\phi, \{a\}, \{b\}, \{ab\}, \{bc\}, \{abc\}, Y\}$ ,  $\alpha^*O(X, \tau) = \{\phi, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, \{abd\}, X\}$   $\alpha^*C(X, \tau) = \{\phi, \{c\}, \{d\}, \{ad\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a map defined by  $f(c) = a, f(a) = f(b) = b, f(d) = c$ , clearly,  $f$  is  $\alpha^*$  continuous but  $f$  is not contra  $\alpha^*$ -continuous because  $f^{-1}(\{b\}) = \{ab\}$  is not  $\alpha^*$ -closed.

**Example 3.20:** Let  $X = Y = \{a, b, c, d\}, \tau = \{\phi, \{a\}, \{b\}, \{ab\}, \{bc\}, \{abc\}, X\}$ , and  $\sigma = \{\phi, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, Y\}$ .  $\alpha^*C(X, \tau) = \{\phi, \{c\}, \{d\}, \{ad\}, \{bd\}, \{cd\}, \{abd\}, \{acd\}, \{bcd\}, X\}$ .  $\alpha^*O(X, \tau) = \{\phi, \{a\}, \{b\}, \{c\}, \{ab\}, \{ac\}, \{bc\}, \{abc\}, \{abd\}, X\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(b) = a, f(d) = c, f(c) = b, f(a) = d$ . clearly,  $f$  is contra  $\alpha^*$  continuous, but  $f^{-1}(\{a\}) = \{bd\}$  is not  $\alpha^*$ -open in  $X$ . Therefore,  $f$  is not  $\alpha^*$  continuous.

**Remark 3.21:** The composition of two contra  $\alpha^*$  continuous need not be contra  $\alpha^*$  continuous.

**Example 3.22:** Consider  $X = Y = Z = \{a, b, c\}, \tau = \{\phi, \{a\}, \{ab\}, \{ac\}, X\}$  and  $\sigma = \{\phi, \{a\}, \{b\}, \{ab\}, Y\}, \eta = \{\phi, \{a\}, \{ab\}, Z\}$ ,  $\alpha^*C(X, \tau) = \{\phi, \{b\}, \{c\}, \{bc\}, X\}$ ,  $\alpha^*C(Y, \sigma) = \{\phi, \{b\}, \{c\}, \{ac\}, \{bc\}, Y\}$ . Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(b) = a, f(c) = b, f(a) = c$ . Clearly,  $f$  is contra  $\alpha^*$ continuous. Consider the map  $g: Y \rightarrow Z$  defined  $g(b) = a, g(c) = b, g(a) = c$ , clearly  $g$  is contra  $\alpha^*$ continuous. But  $g \circ f: X \rightarrow Z$  is not a contra  $\alpha^*$ continuous,  $(g \circ f)^{-1}(\{ab\}) = f^{-1}(g^{-1}\{ab\}) = f^{-1}(\{bc\}) = \{ac\}$  which is not a  $\alpha^*$ closed in  $X$ .

**Theorem 3.23:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a map. The following are equivalent.

1.  $f$  is contra  $\alpha^*$  continuous.
  2. The inverse image of a closed set  $F$  of  $Y$  is  $\alpha^*$  open in  $X$
- Proof:** let  $F$  be a closed set in  $Y$ . Then  $Y \setminus F$  is an open set in  $Y$ . By the assumption of (1),  $f^{-1}(Y \setminus F) = X \setminus f^{-1}(F)$  is  $\alpha^*$  closed in  $X$ . It implies that  $f^{-1}(F)$  is  $\alpha^*$  open in  $X$ . Converse is similar.

**Theorem 3.24:** The following are equivalent for a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ . Assume that  $\alpha^*O(X, \tau)$  ( resp  $\alpha^*C(X, \tau)$ ) is closed under any union ( resp; intersection ).

1.  $f$  is contra  $\alpha^*$  continuous.
2. The inverse image of a closed set  $F$  of  $Y$  is  $\alpha^*$  open in  $X$
3. For each  $x \in X$  and each closed set  $B$  in  $Y$  with  $f(x) \in B$ , there exists an  $\alpha^*$  open set  $A$  in  $X$  such that  $x \in A$  and  $f(A) \subset B$
4.  $f(\alpha^*cl(A)) \subset \ker(f(A))$  for every subset  $A$  of  $X$ .
5.  $\alpha^*cl(f^{-1}(B)) \subset f^{-1}(\ker B)$  for every subset  $B$  of  $Y$ .

**Proof:**

(1)  $\Rightarrow$  (3) Let  $x \in X$  and  $B$  be a closed set in  $Y$  with  $f(x) \in B$ . By (1), it follows that  $f^{-1}(Y \setminus B) = X \setminus f^{-1}(B)$  is  $\alpha^*$  closed and so  $f^{-1}(B)$  is  $\alpha^*$  open. Take  $A = f^{-1}(B)$ . We obtain that  $x \in A$  and  $f(A) \subset B$ .

(3)  $\Rightarrow$  (2) Let  $B$  be a closed set in  $Y$  with  $x \in f^{-1}(B)$ . Since,  $f(x) \in B$ , by (3), there exist an  $\alpha^*$  open set  $A$  in  $X$  containing  $x$  such that  $f(A) \subset B$ . It follows that  $x \in A \subset f^{-1}(B)$ . Hence,  $f^{-1}(B)$  is  $\alpha^*$  open.

(2)  $\Rightarrow$  (1) Follows from the previous theorem

(2)  $\Rightarrow$  (4) Let  $A$  be any subset of  $X$ . Let  $y \notin \ker(f(A))$ . Then there exists a closed set  $F$  containing  $y$  such that  $f(A) \cap F = \phi$ . Hence, we have  $A \cap f^{-1}(F) = \phi$  and  $\alpha^*cl(A) \cap f^{-1}(F) = \phi$ . Hence, we obtain  $f(\alpha^*cl(A)) \cap F = \phi$  and  $y \notin f(\alpha^*cl(A))$ . Thus,  $f(\alpha^*cl(A)) \subset \ker(f(A))$ .

(4)  $\Rightarrow$  (5) Let  $B$  be any subset of  $Y$ . By (4) and lemma [2.13]  $f(\alpha^*cl(f^{-1}(B))) \subset (\ker B)$  and  $\alpha^*cl(f^{-1}(B)) \subset f^{-1}(\ker B)$

(5)  $\Rightarrow$  (1) Let B be any open set in Y. By (5) and lemma [2.13]  $\alpha^*cl(f^{-1}(B)) \subset f^{-1}(\ker B) = f^{-1}(B)$  and  $\alpha^*cl(f^{-1}(B)) = f^{-1}(B)$ . We obtain that  $f^{-1}(B)$  is  $\alpha^*$  closed in X.

**Theorem 3.25:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is  $\alpha^*$  irresolute and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is contra  $\alpha^*$  continuous, then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra  $\alpha^*$  continuous.

**Proof:** Let O be any open set in  $(Z, \eta)$ . Since, g is contra  $\alpha^*$  continuous, then  $g^{-1}(O)$  is  $\alpha^*$  closed in  $(Y, \sigma)$  and since f is  $\alpha^*$  irresolute, then  $f^{-1}(g^{-1}(O))$  is  $\alpha^*$  closed in  $(X, \tau)$ . Therefore,  $g \circ f$  is contra  $\alpha^*$  continuous.

**Theorem 3.26:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha^*$  continuous  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is continuous, then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra  $\alpha^*$  continuous.

**Proof:** Let O be any open set in  $(Z, \eta)$ . Since, g is continuous, then  $g^{-1}(O)$  is open in  $(Y, \sigma)$  and since f is contra  $\alpha^*$  continuous, then  $f^{-1}(g^{-1}(O))$  is  $\alpha^*$  closed in  $(X, \tau)$ . Therefore,  $g \circ f$  is contra  $\alpha^*$  continuous.

**Theorem 3.27:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha$  continuous  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is continuous, then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra  $\alpha^*$  continuous.

**Proof:** Let O be any open set in  $(Z, \eta)$ . Since, g is continuous, then  $g^{-1}(O)$  is open in  $(Y, \sigma)$  and since f is contra  $\alpha$  continuous, then  $f^{-1}(g^{-1}(O))$  is  $\alpha$  closed in  $(X, \tau)$ . Hence by thm [2.15], every  $\alpha$  closed set is  $\alpha^*$  closed. We have  $f^{-1}(g^{-1}(O))$  is  $\alpha^*$  closed in  $(X, \tau)$ . Therefore,  $g \circ f$  is contra  $\alpha^*$  continuous.

**Theorem 3.28:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha^*$  continuous  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is g-continuous, then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra  $\alpha^*$  continuous.

**Proof:** Let O be any open set in  $(Z, \eta)$ . Since, g is g-continuous, then  $g^{-1}(O)$  is g-open in  $(Y, \sigma)$  and since f is contra  $\alpha^*$  continuous, then  $f^{-1}(g^{-1}(O))$  is  $\alpha^*$  closed in  $(X, \tau)$ . Therefore,  $g \circ f$  is contra  $\alpha^*$  continuous.

**Theorem 3.29:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is strongly  $\alpha^*$  continuous and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is contra  $\alpha^*$  continuous, then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra continuous.

**Proof:** Let O any open set in  $(Z, \eta)$ . Since, g is contra  $\alpha^*$  continuous, then  $g^{-1}(O)$  is  $\alpha^*$  closed in  $(Y, \sigma)$  and since f is strongly  $\alpha^*$  continuous,  $f^{-1}(g^{-1}(O))$  is closed in  $(X, \tau)$ . Therefore,  $g \circ f$  is contra continuous.

**Theorem 3.30:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is perfectly  $\alpha^*$  continuous, and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is contra  $\alpha^*$  continuous, then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is .

**Proof:** Let O any open set in  $(Z, \eta)$ . By thm [2.15] every open set is  $\alpha^*$  open set which implies O is  $\alpha^*$  open in  $(Z, \eta)$ . Since, g is contra  $\alpha^*$  continuous, then  $g^{-1}(O)$  is  $\alpha^*$  closed in  $(Y, \sigma)$  and since f is perfectly  $\alpha^*$  continuous, then  $f^{-1}(g^{-1}(O))$  is both open and closed in X, which implies  $(g \circ f)^{-1}(O)$  is both open and closed in X. Therefore,  $g \circ f$  is perfectly  $\alpha^*$  continuous.

**Theorem 3.31:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  is surjective  $\alpha^*$  irresolute and  $\alpha^*$  open and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be any function. Then  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra  $\alpha^*$  continuous if and only if g is contra  $\alpha^*$  continuous.

**Proof:** The if part is easy to prove. To prove the only if part, let F be any closed set in  $(Z, \eta)$ . Since  $g \circ f$  is contra  $\alpha^*$  continuous, then  $f^{-1}(g^{-1}(F))$  is  $\alpha^*$  open in  $(X, \tau)$  and since f is  $\alpha^*$  open surjection, then  $f(f^{-1}(g^{-1}(F))) = g^{-1}(F)$  is  $\alpha^*$  open in  $(Y, \sigma)$ . Therefore, g is contra  $\alpha^*$  continuous.

**Theorem 3.32:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function and X a  $\alpha^* T_{1/2}$  space. Then the following are equivalent:

1. f is contra continuous
2. f is contra  $\alpha^*$  continuous

**Proof:**

(1)  $\Rightarrow$  (2) Let O be any open set in  $(Y, \sigma)$ . Since f is contra continuous,  $f^{-1}(O)$  is closed in  $(X, \tau)$  and since Every closed set is  $\alpha^*$  closed,  $f^{-1}(O)$  is  $\alpha^*$  closed in  $(X, \tau)$ . Therefore, f is contra  $\alpha^*$  continuous.

(2)  $\Rightarrow$  (1) Let O be any open set in  $(Y, \sigma)$ . Since, f is contra  $\alpha^*$  continuous,  $f^{-1}(O)$  is  $\alpha^*$  closed in  $(X, \tau)$  and since X is  $\alpha^* T_{1/2}$  space,  $f^{-1}(O)$  is closed in  $(X, \tau)$ . Therefore, f is contra continuous.

**Theorem 3.33:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha^*$  continuous and  $(Y, \sigma)$  is regular, then f is  $\alpha^*$  continuous.

**Proof:** Let x be an arbitrary point of X and O be any open set of Y containing  $f(x)$ . Since Y is regular, there exists an open set U in Y containing  $f(x)$  such that  $cl(U) \subset O$ . Since, f is contra  $\alpha^*$  continuous, so by thm[3.24], there exists  $N \in \alpha^*O(X, \tau)$ , such that  $f(N) \subset cl(U)$ . Then,  $f(N) \subset O$ . Hence by thm[2.14], f is  $\alpha^*$  continuous.

**Theorem 3.34:** If f is  $\alpha^*$  continuous and if Y is locally indiscrete, then f is contra  $\alpha^*$  continuous.

**Proof:** Let  $O$  be an open set of  $Y$ . Since  $Y$  is locally discrete,  $O$  is closed. Since,  $f$  is  $\alpha^*$  continuous,  $f^{-1}(O)$  is  $\alpha^*$  closed in  $X$ . Therefore,  $f$  is contra  $\alpha^*$  continuous.

**Theorem 3.35:** If a function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is continuous and  $X$  is a locally indiscrete space, then  $f$  is contra  $\alpha^*$  continuous.

**Proof:** Let  $O$  be any open set in  $(Y, \sigma)$ . Since  $f$  is continuous  $f^{-1}(O)$  is open in  $X$ . and since  $X$  is locally discrete,  $f^{-1}(O)$  is closed in  $X$ . Every closed set is  $\alpha^*$  closed.  $f^{-1}(O)$  is  $\alpha^*$  closed in  $X$ . Therefore,  $f$  is contra  $\alpha^*$  continuous

**Theorem 3.36:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function and  $g: X \rightarrow X \times Y$  the graph function, given by  $g(x) = (x, f(x))$  for every  $x \in X$ . Then  $f$  is contra  $\alpha^*$  continuous if  $g$  is contra  $\alpha^*$  continuous.

**Proof:** Let  $F$  be a closed subset of  $Y$ . Then  $X \times F$  is a closed subset of  $X \times Y$ . Since  $g$  is a contra  $\alpha^*$  continuous, then  $g^{-1}(X \times F)$  is a  $\alpha^*$  open subset of  $X$ . Also,  $g^{-1}(X \times F) = f^{-1}(F)$ . Hence,  $f$  is contra  $\alpha^*$  continuous.

**Theorem 3.37:** Let  $\{X_i / i \in I\}$  be any family of topological spaces. If  $f : X \rightarrow \prod X_i$  is a contra  $\alpha^*$  continuous function. then  $\pi_i \circ f : X \rightarrow X_i$  is contra  $\alpha^*$  continuous for each  $i \in I$ , where  $\pi_i$  is the projection of  $\prod X_i$  onto  $X_i$ .

**Proof:** Suppose  $U_i$  is an arbitrary open sets in  $X_i$  for  $i \in I$ . Then  $\pi_i^{-1}(U_i)$  is open in  $\prod X_i$ . Since  $f$  is contra  $\alpha^*$  continuous,  $f^{-1}(\pi_i^{-1}(U_i)) = (\pi_i \circ f)^{-1}(U_i)$  is  $\alpha^*$  closed in  $X$ . Therefore,  $\pi_i \circ f$  is contra  $\alpha^*$  continuous.

For a map  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the subset  $\{(x, f(x)) : x \in X\} \subset X \times Y$  is called the graph of  $f$  and is denoted by  $G(f)$ .

#### IV. Contra $\alpha^*$ closed graph

**Definition 4.1:** The graph  $G(f)$  of a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be **Contra  $\alpha^*$  closed graph** in  $X \times Y$  if for each  $(x, y) \in (X \times Y) - G(f)$  there exists  $U \in \alpha^*O(X, \tau)$  and  $V \in C(Y, \sigma)$  such that  $(U \times V) \cap G(f) = \emptyset$ .

**Lemma 4.2:** The graph  $G(f)$  of a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is  $\alpha^*$  closed in  $(X \times Y)$  if and only if for each  $(x, y) \in (X \times Y) - G(f)$ , there exists an  $U \in \alpha^*O(X, \tau)$  and an open set  $V$  in  $Y$  containing  $y$  such that  $f(U) \cap V = \emptyset$ .

**Proof:** We shall prove that  $f(U) \cap V = \emptyset \Leftrightarrow (U \times V) \cap G(f) = \emptyset$ . Let  $(U \times V) \cap G(f) \neq \emptyset$ . Then there exists  $(x, y) \in (X \times Y)$  and  $(x, y) \in G(f)$ . This implies that  $x \in U$ ,  $y \in V$  and  $y = f(x) \in V$ . Therefore,  $f(U) \cap V \neq \emptyset$ . Hence the result follows.

**Theorem 4.3:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha^*$  continuous and  $Y$  is Urysohn,  $G(f)$  is a contra  $\alpha^*$  closed graph in  $X \times Y$ .

**Proof:** Let  $(x, y) \in (X \times Y) - G(f)$ , then  $y \neq f(x)$  and there exist open sets  $A$  and  $B$  such that  $f(x) \in A$ ,  $y \in B$  and  $\text{cl}(A) \cap \text{cl}(B) = \emptyset$ . Since  $f$  is contra  $\alpha^*$  continuous, there exist  $O \in \alpha^*O(X, \tau)$  such that  $f(O) \subset \text{cl}(A)$ . Therefore, we obtain  $f(O) \cap \text{cl}(B) = \emptyset$ . Hence by lemma [4.2],  $G(f)$  is contra  $\alpha^*$  closed graph in  $X \times Y$ .

**Theorem 4.4:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is  $\alpha^*$  continuous and  $Y$  is  $T_1$ , then  $G(f)$  is Contra  $\alpha^*$  closed graph in  $X \times Y$ .

**Proof:** Let  $(x, y) \in (X \times Y) - G(f)$ , then  $y \neq f(x)$  and since  $Y$  is  $T_1$  there exists open set  $V$  of  $Y$ , such that  $f(x) \in V$ ,  $y \notin V$ . Since  $f$  is  $\alpha^*$  continuous, there exist  $\alpha^*$  open set  $U$  of  $X$  containing  $x$  such that  $f(U) \subset V$ . Therefore,  $f(U) \cap (Y - V) = \emptyset$  and  $Y - V$  is a closed set in  $Y$  containing  $y$ . Hence by lemma [4.2],  $G(f)$  is Contra  $\alpha^*$  closed graph in  $X \times Y$ .

**Definition 4.5** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called **almost contra  $\alpha^*$  continuous** if  $f^{-1}(O)$  is  $\alpha^*$  closed set in  $X$  for every regular open set  $O$  in  $Y$ .

**Theorem 4.6** Every contra  $\alpha^*$  continuous function is almost contra  $\alpha^*$  continuous.

**Proof:** Let  $O$  be a regular open set in  $Y$ . Since, every regular open set is open which implies  $O$  is open in  $Y$ . Since  $f : (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha^*$  continuous then  $f^{-1}(O)$  is  $\alpha^*$  closed in  $X$ . Therefore,  $f$  is almost contra  $\alpha^*$  continuous.

**Remark 4.7:** The converse of the above theorem need not be true.

**Example 4.8:** Let  $X = Y = \{a, b, c\}$ ,  $\sigma = \{\emptyset, \{a\}, \{b\}, \{ab\}, Y\}$ .  $\text{RO}(Y, \sigma) = \{\emptyset, \{a\}, \{b\}, Y\}$ ,  $\alpha^*C(X, \tau) = \{\emptyset, \{a\}, \{b\}, \{c\}, \{ab\}, \{bc\}, \{ac\}, X\}$ . Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be defined by  $f(a) = a$ ,  $f(b) = b = f(c)$ . clearly,  $f$  is contra  $\alpha^*$  continuous, but  $f^{-1}(\{b\}) = \{bc\}$  is not regular open in  $X$ . Therefore,  $f$  is not almost contra  $\alpha^*$  continuous.

**Theorem 4.9:** The following are equivalent for a function  $f: (X, \tau) \rightarrow (Y, \sigma)$

1.  $f$  is almost contra  $\alpha^*$  continuous.
2.  $f^{-1}(F)$  is  $\alpha^*$  open in  $X$  for every regular closed set  $F$  in  $Y$ .

3. for each  $x \in X$  and each regular open set  $F$  of  $Y$  containing  $f(x)$ , there exists  $U \in \alpha * O(X, x)$  such that  $f(U) \subset F$
4. for each  $x \in X$  and each regular open set  $V$  of  $Y$  non – containing  $f(x)$ , there exists an  $\alpha$  \* closed set  $K$  of  $X$  non – containing  $x$  such that  $f^{-1}(V) \subset K$

**Proof:**

- (1)  $\Leftrightarrow$  (2) Let  $F$  be any regular closed set of  $Y$ . Then  $(Y - F)$  is regular open and therefore  $f^{-1}(Y - F) = X - f^{-1}(F) \in \alpha * C(X)$ . Hence,  $f^{-1}(F)$  is  $\alpha$  \* open in  $X$ . The converse part is obvious.
- (2)  $\Rightarrow$  (3) Let  $F$  be any regular closed set of  $Y$  containing  $f(x)$ . Then  $f^{-1}(F)$  is  $\alpha$  \* open in  $X$  and  $x \in f^{-1}(F)$ . Taking  $U = f^{-1}(F)$  we get  $f(U) \subset F$ .
- (3)  $\Rightarrow$  (2) Let  $F$  be any regular closed set of  $Y$  and  $x \in f^{-1}(F)$ . Then there exists  $U_x \in \alpha * O(X, x)$  such that  $f(U_x) \subset F$  and so  $U_x \subset f^{-1}(F)$ . Also, we have  $f^{-1}(F) \subset \cup_{x \in f^{-1}(F)} U_x$ . Hence,  $f^{-1}(F)$  is  $\alpha$  \* open in  $X$ .
- (3)  $\Leftrightarrow$  (4) Let  $V$  be any regular open set of  $Y$  non containing  $f(x)$ . Then  $(Y - V)$  is regular closed set in  $Y$  containing  $f(x)$ . Hence by (c), there exists  $U \in \alpha * O(X, x)$  such that  $f(U) \subset (Y - V)$ . Hence,  $U \subset f^{-1}(Y - V) \subset X - f^{-1}(V)$  and so  $f^{-1}(V) \subset (X - U)$ . Now, since  $U \in \alpha * O(X)$ ,  $(X - U)$  is  $\alpha$  \* closed set of  $X$  not containing  $x$ . The converse part is obvious.

**Definition 4.7:** A space  $X$  is said to be **locally  $\alpha$  \* indiscrete** if every  $\alpha$  \*open set of  $X$  is closed in  $X$ .

**Theorem 4.8:** A contra  $\alpha$  \*continuous function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is continuous when  $X$  is locally  $\alpha$  \* indiscrete.

**Proof:** Let  $O$  be an open set in  $Y$ . Since,  $f$  is contra  $\alpha$  \*continuous then  $f^{-1}(O)$  is  $\alpha$  \* closed in  $X$ . Since,  $X$  is locally  $\alpha$  \* indiscrete which implies  $f^{-1}(O)$  is open in  $X$ . Therefore,  $f$  is continuous.

**Theorem 4.9:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  is  $\alpha$  \*irresolute map with  $Y$  as locally  $\alpha$  \* indiscrete space and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  is contra  $\alpha$  \*continuous, then  $g \circ f$  is  $\alpha$  \*continuous.

**Proof:** Let  $B$  be any closed set in  $Z$ . Since  $g$  is contra  $\alpha$  \*continuous,  $g^{-1}(B)$  is  $\alpha$  \* open in  $Y$ . But  $Y$  is locally  $\alpha$  \* indiscrete,  $g^{-1}(B)$  is closed in  $Y$ . Hence,  $g^{-1}(B)$  is  $\alpha$  \*closed in  $Y$ . Since,  $f$  is  $\alpha$  \*irresolute,  $f^{-1}(g^{-1}(B)) = (g \circ f)^{-1}(B)$  is  $\alpha$  \*closed in  $X$ . Therefore,  $g \circ f$  is  $\alpha$  \*continuous.

**Definition 4.10:** A map  $f : (X, \tau) \rightarrow (Y, \sigma)$  is said to be **pre  $\alpha$  \*open** if the image of every  $\alpha$  \*open set of  $X$  is  $\alpha$  \*open in  $Y$ .

**Theorem 4.11:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be surjective  $\alpha$  \* irresolute pre  $\alpha$  \*open and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  be any map. Then  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is contra  $\alpha$  \*continuous if and only if  $g$  is contra  $\alpha$  \*continuous.

**Proof:** The if part is easy to prove. To prove the “ only if “ part, let  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  be contra  $\alpha$  \*continuous and let  $B$  be a closed subset of  $Z$ . Then  $(g \circ f)^{-1}(B)$  is  $\alpha$  \*open in  $X$  which implies  $f^{-1}(g^{-1}(B))$  is  $\alpha$  \*open in  $X$ . Since,  $f$  is pre  $\alpha$  \*open,  $f(f^{-1}(g^{-1}(B)))$  is  $\alpha$  \*open of  $Y$ . So,  $g^{-1}(B)$  is  $\alpha$  \*open in  $Y$ . Therefore,  $g$  is contra  $\alpha$  \*continuous.
